CALIBER MINING AND LOGISTICS LIMITED · PULSE-II

OT & Multiple Duties report

How to check and review it, step by step

For site in-charges, MIS staff and reviewers · Matches the system as of 10 November 2026 · The pictures use sample data, not real drivers

1. What this report tells you

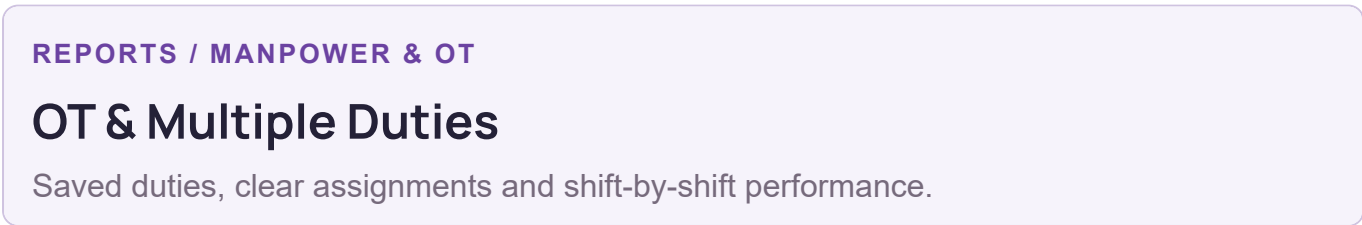

The report finds drivers and operators who worked more than one shift, from the log books already saved in Pulse-II: Vehicle Log Book (VLB), Equipment Log Book (ELB) and LMV Log Book. Each such finding is called a **case** and gets one of three colours.

Colour	What it means
Red	Two shifts back to back on the same day, all three shifts in one day, or Shift 3 followed by the next day's Shift 1.
Orange	Shift 1 and Shift 3 on the same day, with a shift of rest in between.
Brown	More than one duty, but the shift timing or pattern could not be confirmed from the Shift Master. Someone has to look at it. In the lists its reason starts with the word REVIEW.

> **Keep in mind.** The report reads saved cards only. A card still waiting in scanning, or a deleted card, is not counted. Shift times come from the Shift Master, not from attendance. HMR hours are machine hours, not payable OT hours.

2. Open the report and choose the dates

1. In the left menu open **Reports** → **Manpower & OT** → **OT & Multiple Duties**.
2. The report opens on today's date. In the filters at the top set **From** and **To** for the days you want. Press **Today** to come back to today's date.
3. You can choose up to 31 days at a time, starting from 1 November 2026.
4. To see one site only, choose it in **Site**. Its date-by-shift table and its drivers then open straight away.
5. Press **Refresh reports** to read the latest saved cards.

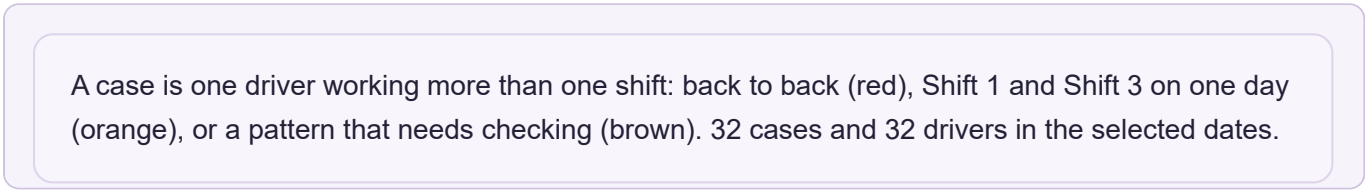

Picture 1. The report page. OT & Multiple Duties is the last of the four Manpower & OT tabs. *Sample data.*

Picture 2. The filters. The top line always shows the dates in use. Tick Auto-hide filters to tuck the selectors away. *Sample data.*

> **More room on screen.** Tick **Auto-hide filters** to fold the selectors into one line; they open when you point at the line. In the left menu, **Auto-hide menu** does the same for the menu. If the page looks old after an update, press **Ctrl + F5** once.

3. Choose the log book

Under the filters, one line says what is counted and how many cases and drivers were found in your dates. Below it is the log book selector.

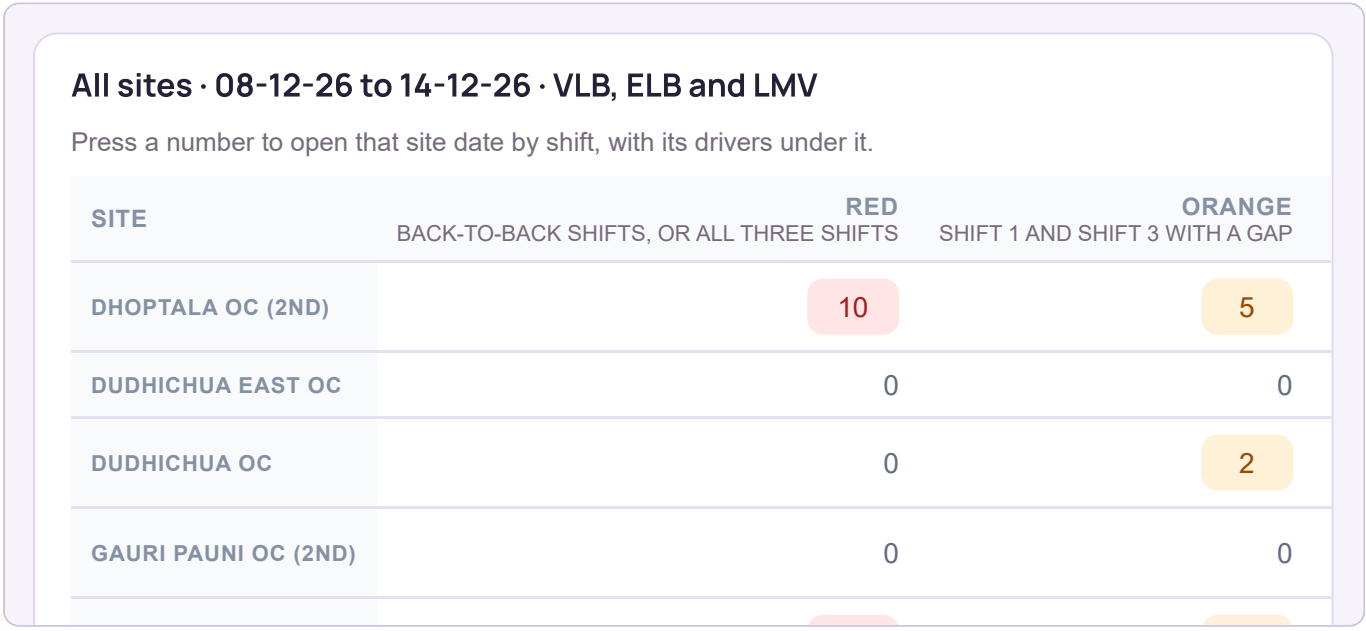

Picture 3. The line that says what is counted, and the log book selector. All log books is chosen at the start. *Sample data.*

- **All log books** counts the cases on VLB, ELB and LMV together. Press **VLB**, **ELB** or **LMV** to see only the cases that include that log book. Every number on the page follows the selector.
- A case done on two log books, for example a tipper in Shift 1 and an LMV in Shift 2, is counted under both. So VLB + ELB + LMV can be more than All log books. This is correct.

4. Read the site table

The table has one line for every site assigned to your login, and an **All sites** line at the bottom.

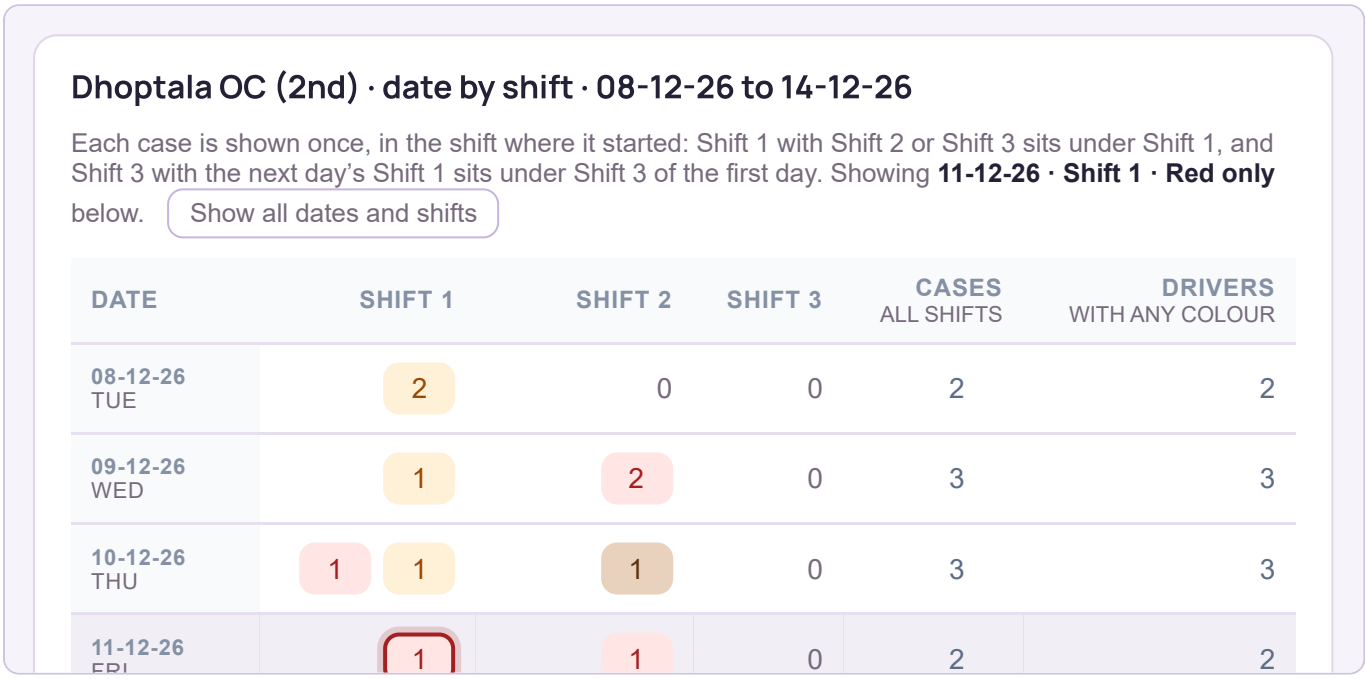

Picture 4. One line per site: red, orange and brown cases and the number of drivers. Every number can be pressed. *Sample data.*

Column	What it shows
Red, Orange, Brown	The number of cases of that colour at the site, in the dates you chose.
Drivers	How many different drivers at the site have a case of any colour.

- **Press a red, orange or brown number** to open that site: first its date-by-shift table (section 5), and under it the drivers of that colour. **Press the number under Drivers** to open the site with all colours.
- Press the same number again to close the site.
- A line with all zeros means the site was checked and nothing was found.
- A number on the **All sites** line lists the drivers of every site together. That list has a Site column.

5. The site, date by shift

When a site is open, a second table shows its cases day by day and shift by shift. It has one line for every date you chose, and an **All dates** line at the bottom when you chose more than one date.

Picture 5. The opened site, date by shift. Each box shows the red, orange and brown cases that started in that shift. Here the red number of 11-12-26, Shift 1 has been pressed. *Sample data.*

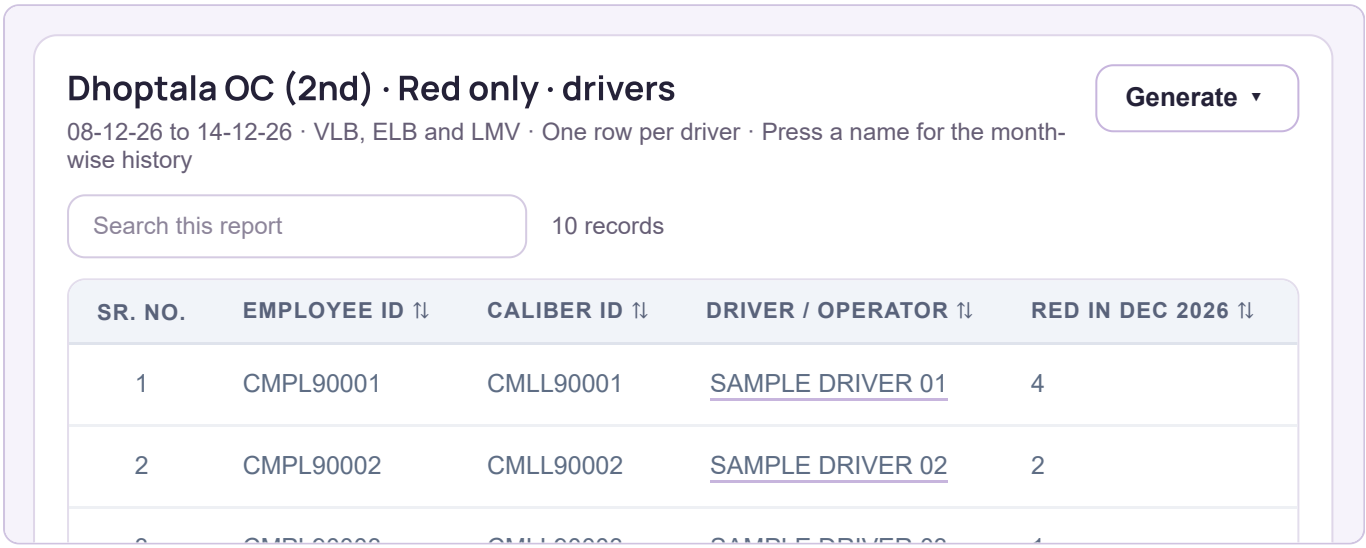

Column	What it shows
Date	The duty date, with the day of the week.
Shift 1, Shift 2, Shift 3	The cases that **started** in that shift on that date. A red number is the red cases, an orange number the orange cases, a brown number the brown cases. 0 means none.
Cases	All cases of that date, of every shift and colour.
Drivers	How many different drivers have a case on that date.

> **Each case is counted once, in the shift where it started.** Shift 1 with Shift 2 is under Shift 1. Shift 2 with Shift 3 is under Shift 2. Shift 1 with Shift 3, and all three shifts, are under Shift 1. Shift 3 followed by the next day's Shift 1 is under Shift 3 of the first day. So the table adds up exactly to the site's line in the site table.

- **Press a coloured number** to list, below, only the drivers of that date, shift and colour. **Press the number under Cases** to list everyone of that date.
- A number on the **All dates** line lists that shift for all the dates together.
- Press the same number again, or **Show all dates and shifts**, to come back to the whole site.
- A line marked **night before the selected dates** holds a case that started in Shift 3 on the evening before your From date and continued into Shift 1 of your first day.

6. The drivers list and the OT counts

Below the date-by-shift table is the drivers list, one row per driver. It follows what you pressed: the whole site, or one date and shift.

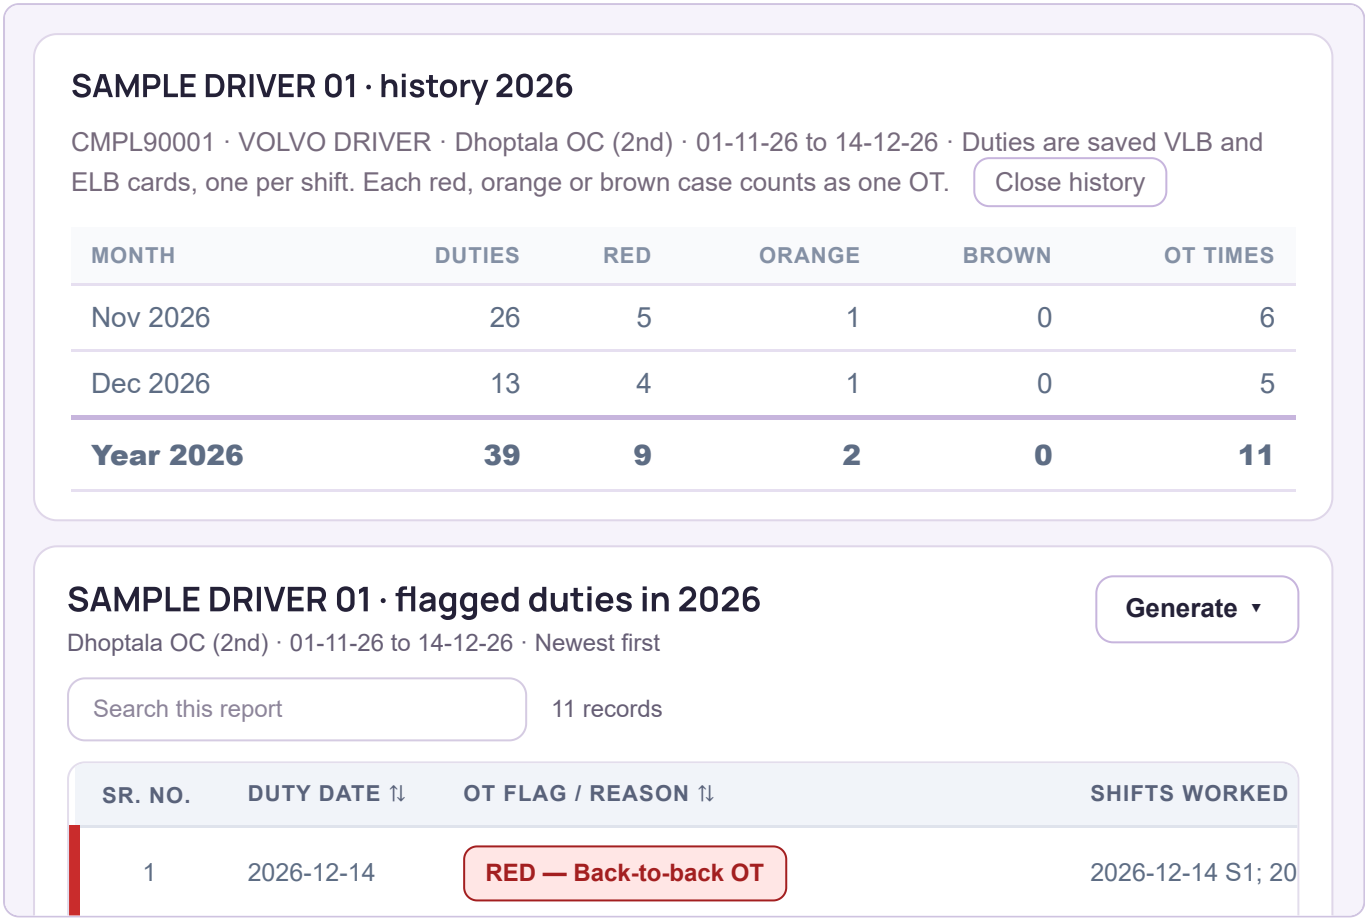

Picture 6. The drivers list after a red number is pressed: one row per driver, with his red and orange counts for the month and for the year. *Sample data.*

Column	What it shows
Red in the month, Orange in the month	Right after the name. How many red cases and how many orange cases the driver has in the calendar month of your To date, at this site.
Red in the year, Orange in the year	The same two counts for the calendar year. Records start on 1 November 2026, so 2026 covers November and December.
Driver category	The driver's current designation in the Employee master. "Category not in Employee master" means none is saved; get the Employee master corrected.
Red, Orange and Brown in selected dates	The driver's cases of each colour inside what you opened: the dates you chose, or the one date and shift you pressed.
Cases in selected dates	The total of the three.
Log book, duty dates, shifts, equipment	Where and when those duties were done.

> **One OT is one case.** The month and year columns count red and orange apart; brown cases are in the driver's history (section 7). While the counts are being read the cells say "Checking…". They never show 0 before the answer has come. In a list opened from the All sites line the cells say "Press the name": the counts are read for one site at a time, when you press a driver's name.

7. One driver’s history

Press the driver’s name. His history for the year opens below the list.

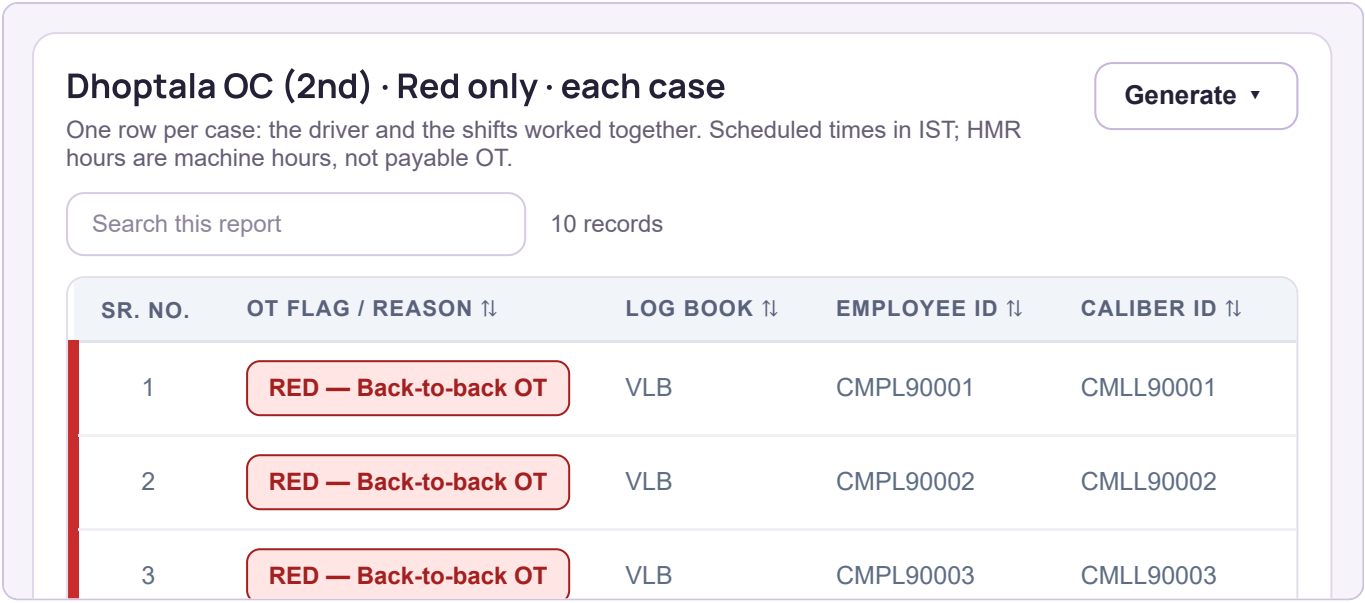

Picture 7. Press a driver’s name to open his history: duties and OT month by month, then every flagged duty, newest first. *Sample data.*

- The first table goes month by month: **Duties** (saved VLB and ELB cards, one per shift), then Red, Orange, Brown and **OT times**, with the year total in the last row.
- The second table lists every case of the year, newest first, with the shifts worked and the saved card numbers.
- Press the name again, or **Close history**, to close it.

8. Each case

Below the drivers list, the table **each case** lists every case in full, for the site, colour, date and shift you opened.

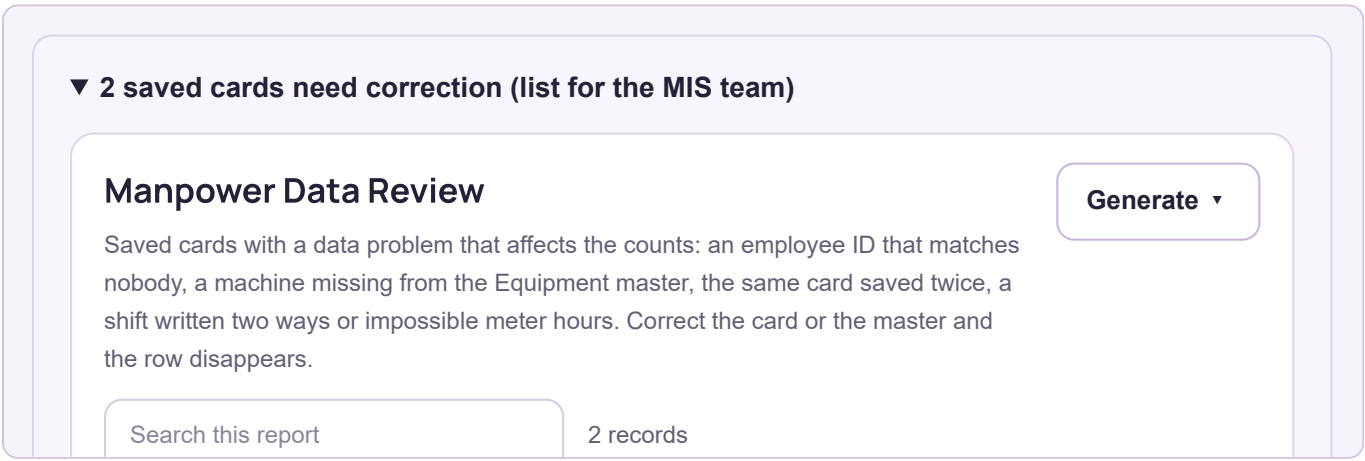

Picture 8. Each case: one row per case, with the shifts worked and the saved cards behind it. *Sample data.*

Column	How to use it
OT flag / reason	The colour and the exact reason.
Log book	VLB, ELB, LMV, or two of them joined, such as VLB + LMV.
Shifts worked, scheduled start / end, gap	Which shifts, the Shift Master timings, and the rest between the duties.
Saved cards, source batches	The card numbers and batches the case came from. Use these to open and check the original entry.
Remarks / review	Anything doubtful in the cards, such as a missing meter reading.

9. Cards that need correction

Near the bottom of the page one line reads **"… saved cards need correction (list for the MIS team)"**. Press it to open **Manpower Data Review**: saved cards that could not be counted properly. Until they are corrected, the counts above may be short. The line is not shown when no card needs correction.

Picture 9. The line "saved cards need correction", opened: saved cards that could not be counted properly. *Sample data.*

What to correct, as shown	What to do
Employee ID is missing or cannot be resolved	The card has no valid driver. Correct the Employee ID on the saved card.
Equipment master match is missing	The door number on the card is not in the Equipment master. Correct the card or the master.
Shift schedule is missing or ambiguous	The Shift Master has no clear timing for that site and shift. Get the Shift Master corrected.
Possible repeated scan / card	The same card appears to be saved twice. Compare the two cards and remove the wrong one.

10. Download, print and search

- The drivers list, the driver's history and the case table each have a **Generate** button: **Download as PDF**, **Download as Excel** or **Smart Print**. The file contains all rows of that table, not only the ones on screen.
- Type in **Search this report** to find a driver, door number or card inside a table.
- Press a column heading to sort by that column.

11. Daily review routine

Step	Do this
1	Open the report and set the dates to the day or days you are reviewing.
2	Leave the selector on All log books. In the site table read the Red column first, then Orange, then Brown.
3	Press the red number of each site that has one. The site opens date by shift. Read which dates and shifts carry the cases, and press a number there to see only those drivers.
4	For each driver, read Red and Orange in the month and in the year. Press the name of anyone who repeats and read his history.
5	Before reporting a case, check it in the table "each case": shifts worked and saved cards. A wrong driver ID or a wrong shift on a card creates a false OT. Get such cards corrected in the log book.
6	Open the line "saved cards need correction" and get every listed card or master entry corrected.
7	Use Generate to download the drivers list or the case table for your record or report.

> **This guide shows how to find and verify the cases.** What action to take on a red or orange case is as instructed by management.

12. Common questions

Question	Answer
A driver did OT but is not in the report.	Check that both cards are saved (not pending in scanning), carry the same Employee ID, and are at the same site. Open the line “saved cards need correction” and look for his cards.
The numbers changed since the morning.	More cards were saved, corrected or deleted. Press **Refresh reports** for the latest position.
VLB + ELB + LMV is more than All log books.	A case done on two log books is counted under both. All log books counts it once.
A driver did Shift 1 and Shift 2 but is not under Shift 2.	A case is shown once, in the shift where it started, so he is under Shift 1. The case table shows both shifts.
The date table has a line for the day before my From date.	That case started in Shift 3 the evening before and ran into Shift 1 of your first day. It is counted in the site’s line as well.
Red in the year is the same as Red in the month.	That happens in the first month of records, or when all his red cases of the year are in this month.
The month and year cells say “Press the name”.	You opened the All sites line. Press the driver’s name: the counts of his site are then read.
A driver works at two sites.	Counts are for one site at a time. In the All sites list he has one row for each site.
I do not see a site.	You see only the sites assigned to your login. Ask the administrator.
