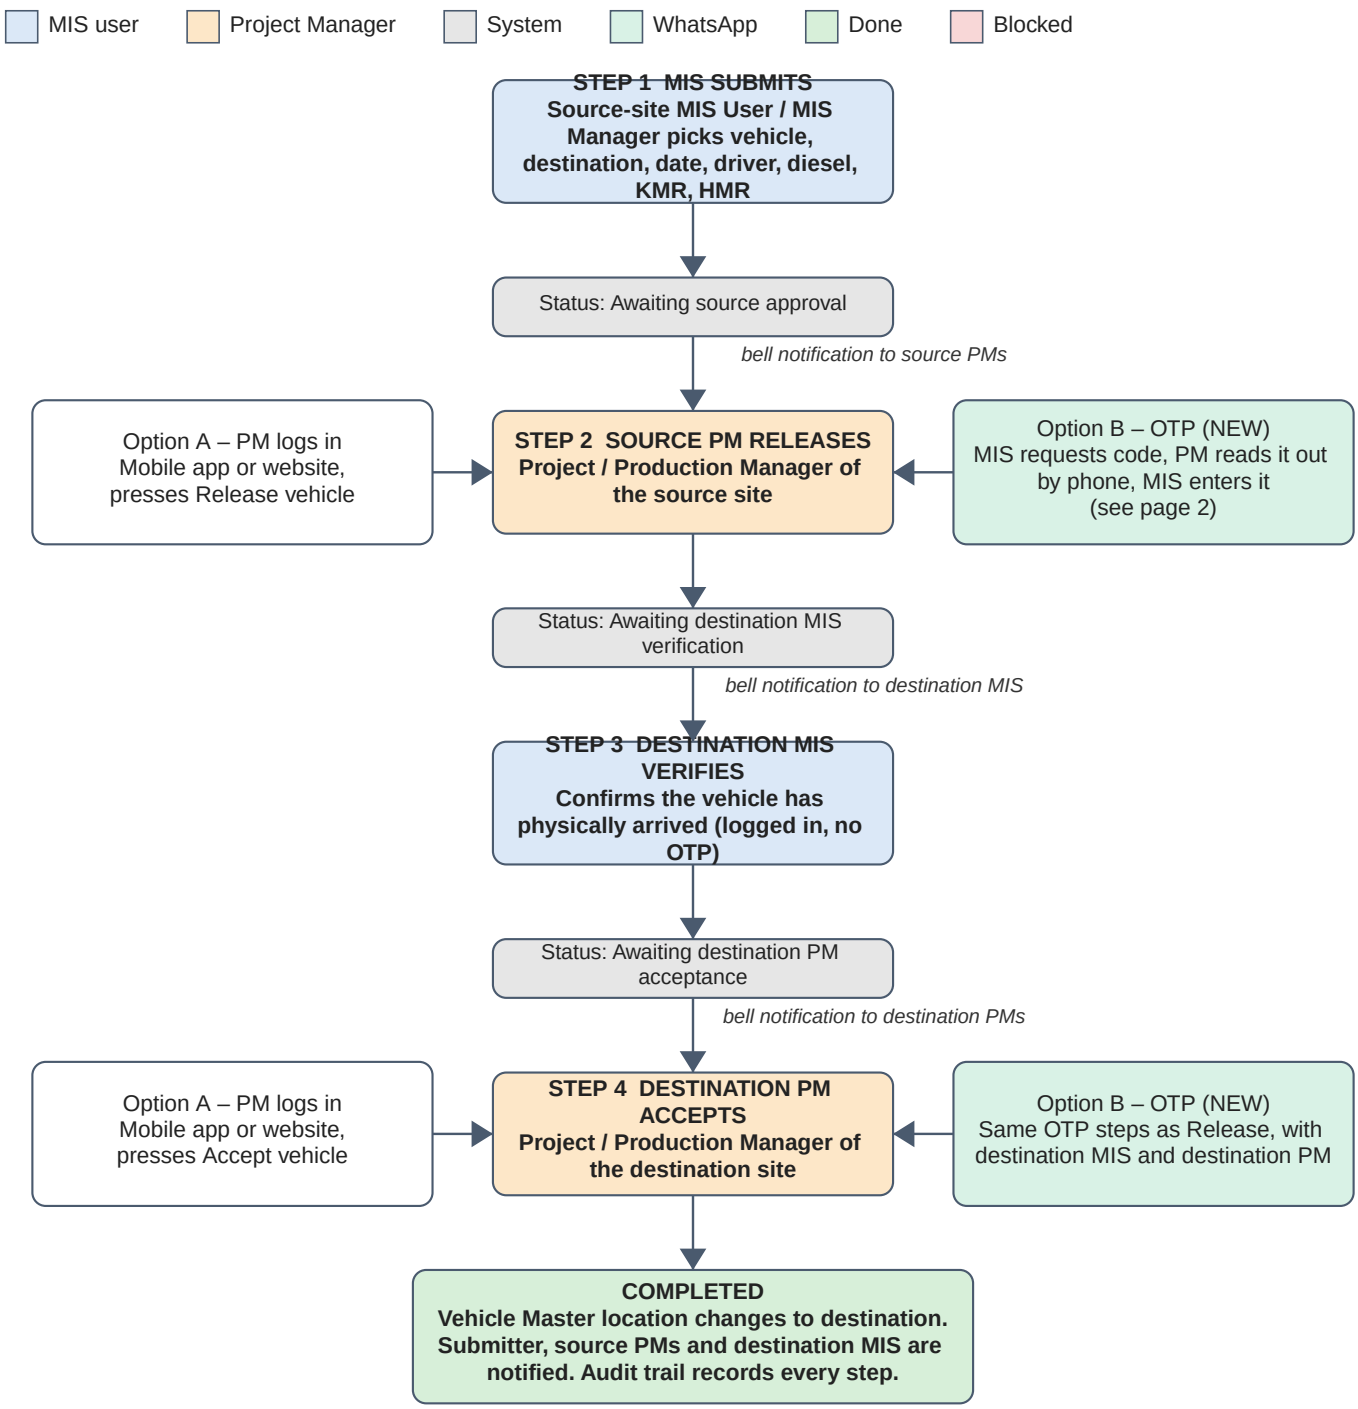
Vehicle Transfer – Overall Flow with OTP

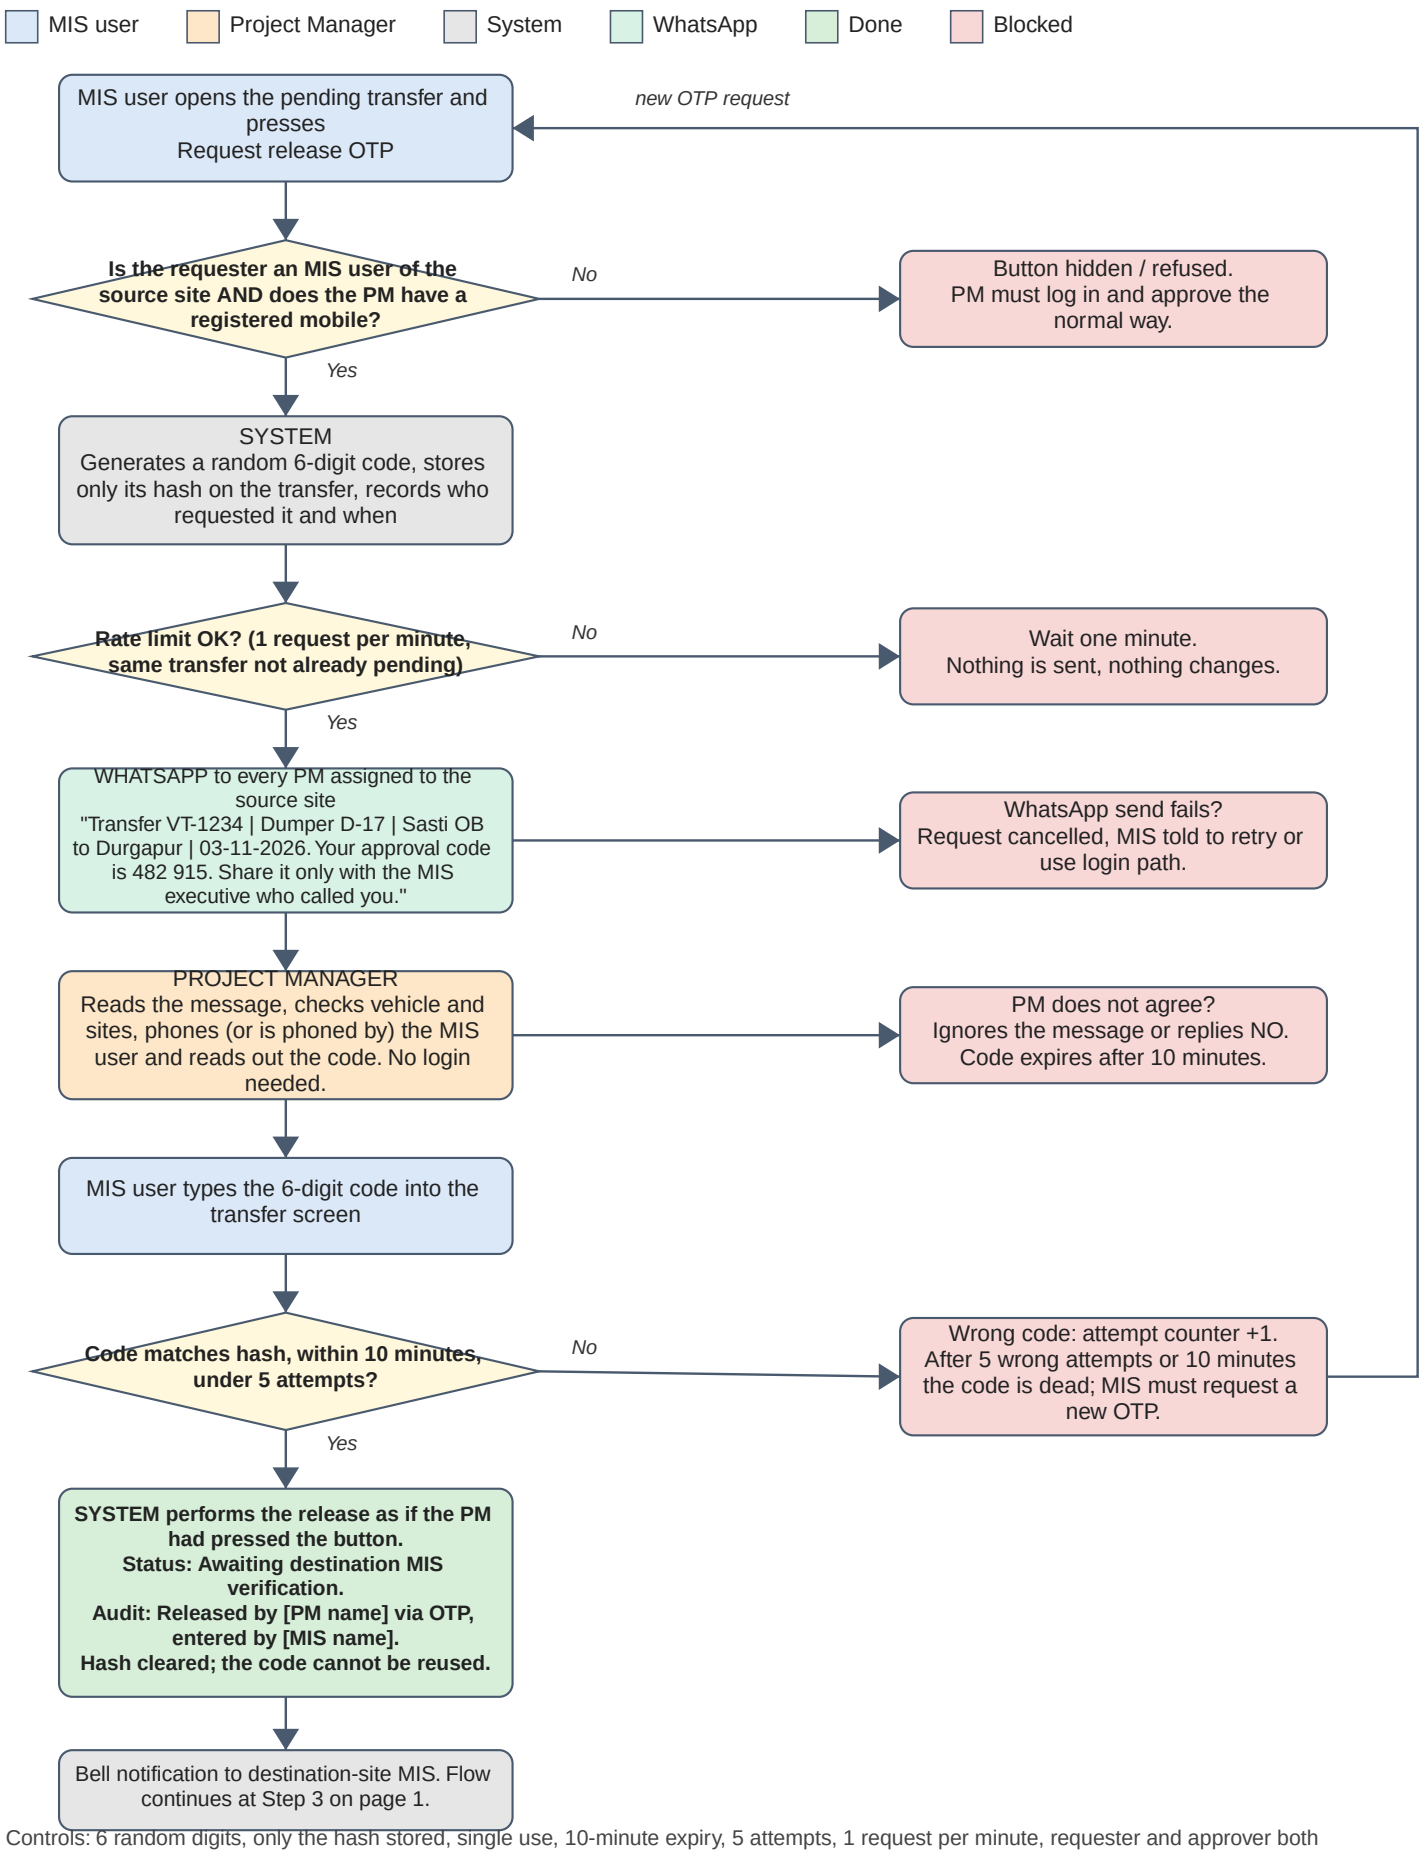
How a transfer moves from the source site to the destination site. The two orange PM stages gain the OTP option shown on page 2.



Rules that apply throughout: only one live transfer per vehicle; a PM can act only for sites assigned to them; administrators can view but not approve; every action is written to the audit log.

OTP Approval – Detailed Flow (Release stage)

The Accept stage follows the same steps with destination-site MIS and destination-site PM.



Controls: 6 random digits, only the hash stored, single use, 10-minute expiry, 5 attempts, 1 request per minute, requester and approver both recorded. Where a site has two PMs both receive the code and the first valid entry wins.
