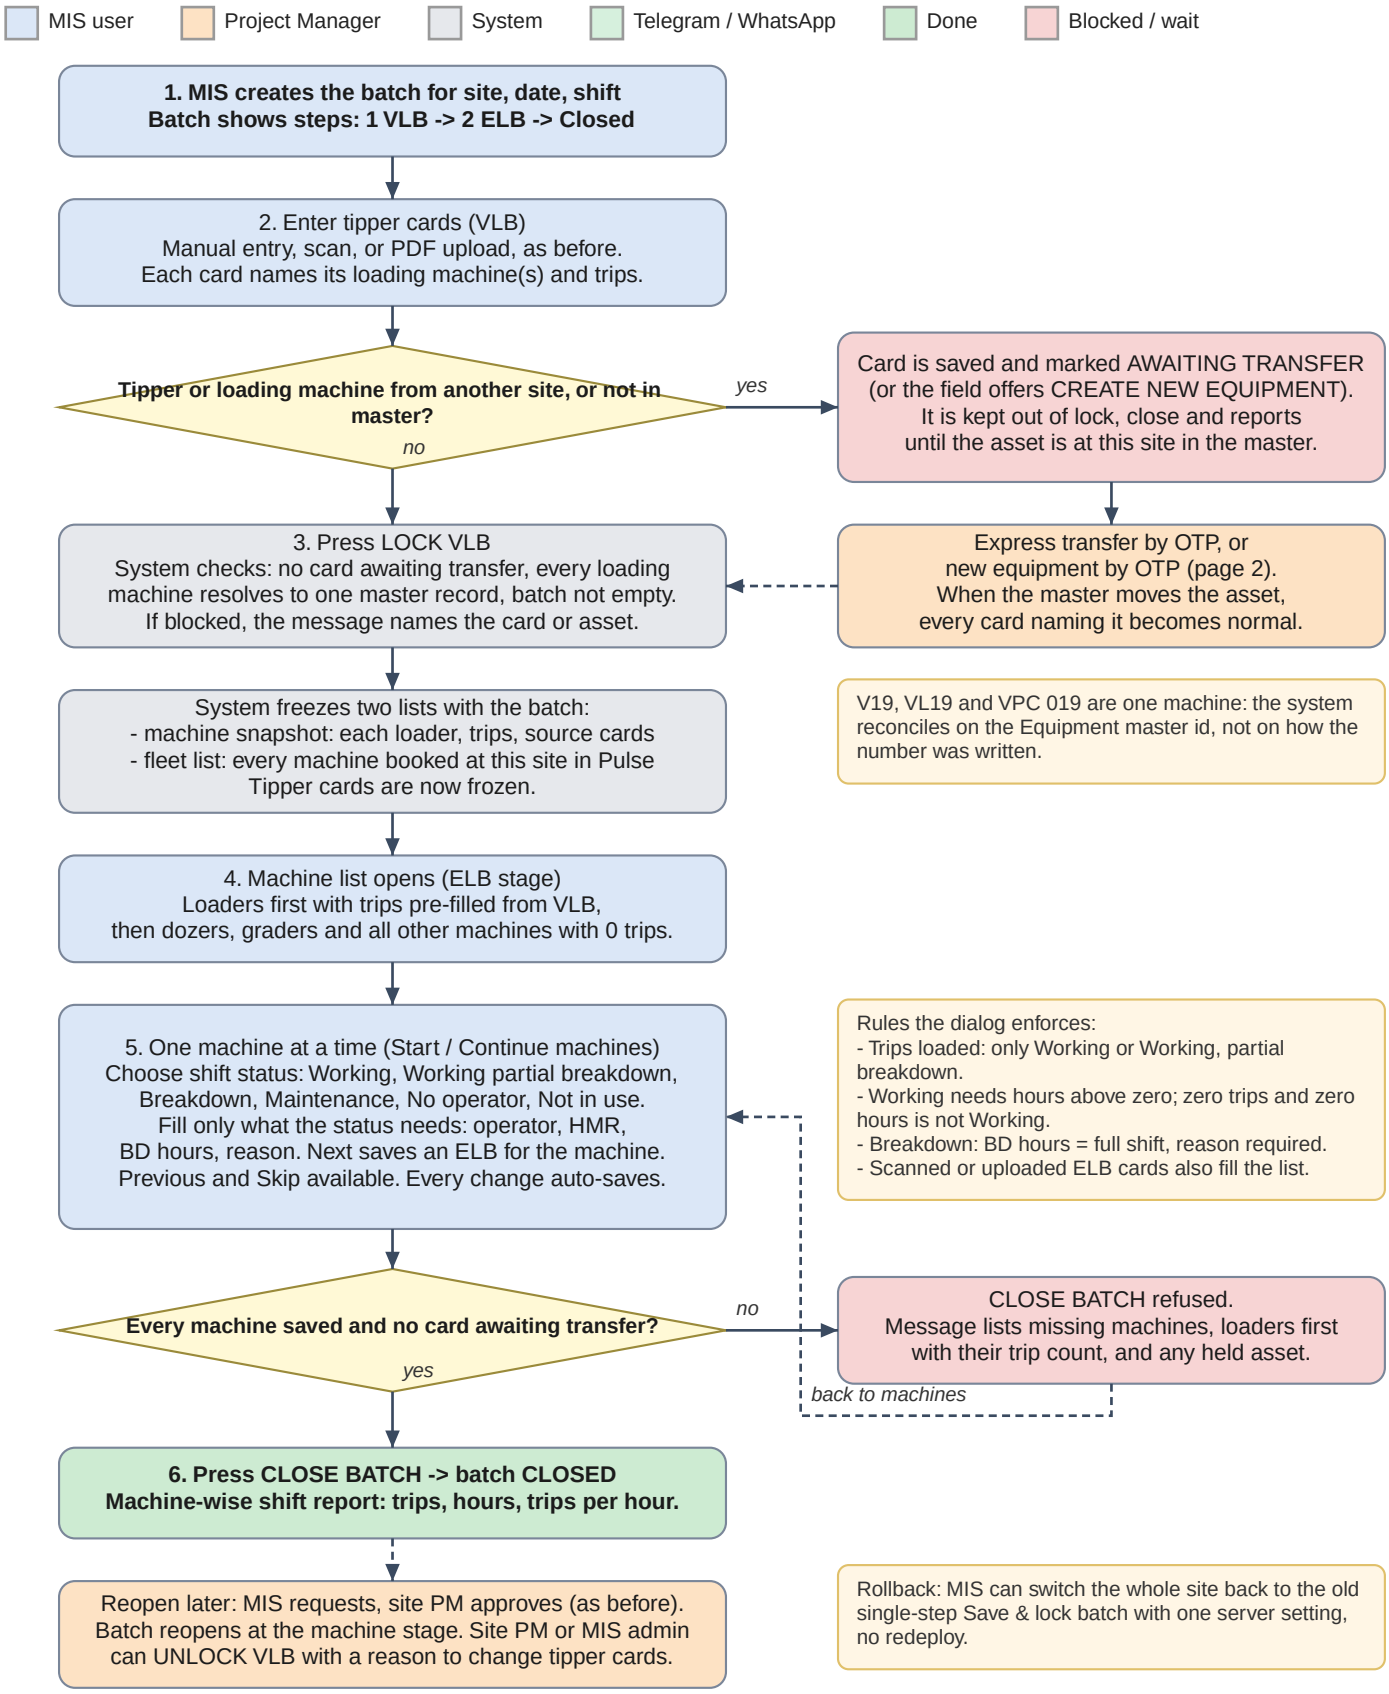
VLB + ELB Batch: working process

Page 1 of 2. One batch per site, date and shift. Left column: the main path. Right column: what happens when a card names an asset from another site or an unknown asset (detail on page 2).



Assets from another site, and new assets: OTP approval

Page 2 of 2. Left: express transfer when the asset is booked at another site. Right: new equipment that exists at no site. Controls for both: 6 digits, 10 minutes, 5 wrong attempts, one request per minute, single use.

MIS user | Project Manager | System | Telegram / WhatsApp | Done | Blocked / wait

A. Express transfer by OTP

Card saved; asset shows AWAITING TRANSFER in the batch panel: current site, cards, trips.

MIS presses EXPRESS TRANSFER (OTP) on the asset row.
One request covers every card naming that asset.

System raises a Vehicle transfer:
from = asset's current site, to = batch site,
or reuses a pending transfer to the same site.
One live transfer per asset.

OTP sent to every PM of the SOURCE site
(the site that currently owns the asset).
Telegram if linked, else WhatsApp to registered mobile.
Message names asset, sites, date, requester, batch.

Source-site PM checks the asset really is at the other site, then reads the code to the MIS user by phone. Reading it out = dispatch approval.
To refuse: ignore; the code expires in 10 minutes.

Code correct, within 10 min, under 5 attempts?

yes

Wrong: retry or new OTP after 1 min

System completes the transfer in one step:
- source approval = the PM(s) who received the OTP
- destination verification = the requesting MIS user
- destination acceptance = implied (destination asked)
Equipment master moves the asset. Destination PMs get a notification. Audit records all three steps.

Hold clears on the next read: every card naming the asset in this batch, including its ELB, is normal. Lock VLB / Close batch proceed.

B. New equipment by OTP

Door number matches nothing in the master.
Field shows CREATE NEW EQUIPMENT.

MIS fills door, Vehicle/Equipment, name, make, model, registration, chassis. Site = batch site.
Chassis or registration is compulsory
(Pulse links the asset by one of them).

no

Same chassis, registration or door exists anywhere?

yes

Not a new asset. System says where it is and offers the express transfer instead (column A).

OTP sent to the PM of the ENTERING site
(your own site). Telegram if linked, else WhatsApp.

Own-site PM confirms it is a genuine new asset and reads the code to the MIS user.

Code correct, within 10 min, under 5 attempts?

yes

Wrong: retry / new OTP

System creates the asset at your site with who approved and who entered it.
The waiting card can now be saved.

Asset exists at your site. Card saved, batch continues.

Pulse remains the only Equipment master. Until Pulse accepts these two writes directly, each express transfer and each new asset updates the Pulse-II copy and is marked "local-only"; the Pulse administrator records the same transfer or asset in Pulse so the next sync agrees. If a PM has neither Telegram linked nor a mobile registered, the OTP cannot be sent and the normal Vehicle transfers workflow or Masters entry applies.
